## WE DEVELOP AND PRODUCE **Microfluidic Lab-on-a-Foil Systems**

Single entry point to  
research & development  
services

Comprehensive  
service portfolio

Fast prototyping  
and scale up

Multiple funding  
opportunities

Quality  
assurance

### We offer funding to scale up your application

- ✓ Open Call applications accepted on a rolling basis until September 2023
- ✓ Access to all services of the EU Horizon Europe project NextGenMicrofluidics
- ✓ Funding rate of up to 92% for European SMEs and 50% for Large Enterprises

## Webinar: Lab-on-a-Chip for Molecular Diagnostics

29 SEP 2022, 13:00 CEST

---

**Presented by Jörg Nestler**  
Founder & Managing Director  
BiFlow Systems GmbH

[www.microfluidicshub.eu](http://www.microfluidicshub.eu)

**bi.FLOW**  
systems  
GmbH  
biofluidic integration

# Content

- BiFlow Systems company profile
- Lab-on-a-Chip (for molecular diagnostics)
  - Towards Integration
  - Towards Multiplexing
  - Towards Speed
- Examples
  - Bacterial species identification / AMR testing
  - Respiratory diseases

# BiFlow Systems GmbH

- Founded in 2011
- 18 Employees
- 250m<sup>2</sup> manufacturing space
- Contact:  
**BiFlow Systems GmbH**  
Technologie-Campus 1  
09126 Chemnitz, Germany

# Lab-on-a-Chip

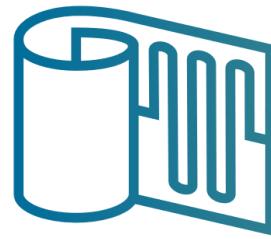

## - some introductory words -

# Lab-on-a-Chip

- Lab-on-a-Chip (LoC) =  
Small microfluidic system that can perform one or more  
laboratory functions
- It is typically larger than a „chip“ !
- Today, we will
  - focus on LoC for Molecular Diagnostics  
(DNA/RNA-based)
  - do NOT talk about lateral flow strips

Microfluidics  
InnovationHub

# Towards Integration

# Integration – what

- Major functionalities required for molecular assay:

|                         | Pumping                            | Valving                            | Heating |
|-------------------------|------------------------------------|------------------------------------|---------|
| Reagent storage         |                                    | X                                  |         |
| Lysis                   | (X)                                |                                    | X       |
| Purification            | X                                  | X                                  |         |
| Amplification           | (X)                                | (X)                                | X       |
| Detektion/Hybridization | (X)<br>in case of<br>hybridization | (X)<br>in case of<br>hybridization | X       |

→ All of them can be either integrated in a disposable,  
or provided by the instrument (or as external process step)

# Integration – why

- Low vs. high level of integration:

|               | <b>Low level of integration</b><br>(Functions performed by instrument)    | <b>High level of integration</b><br>(Functions performed by „disposable“)   |
|---------------|---|---|
| Advantages    | <ul style="list-style-type: none"><li>- Cheaper disposable</li></ul>      | <ul style="list-style-type: none"><li>- Simple control of disposable</li><li>- Simpler instrument (or even just a mobile phone), as no mechanical / pneumatic interface needed in instrument</li><li>- Less maintenance of instrument</li></ul> |
| Disadvantages | <ul style="list-style-type: none"><li>- More complex instrument</li></ul> | <ul style="list-style-type: none"><li>- Disposable more costly</li></ul>  |

# Our approach to „full integration“

Flexible Microfluidic Platforms  
not requiring any tubing, external pumps  
or external heaters

- ✓ Integrated reagents, micropumps & heaters
- ✓ Low-Cost polymer Lab-on-Chip platforms
- ✓ Standard products ready for evaluation

no tubing

no external pumps

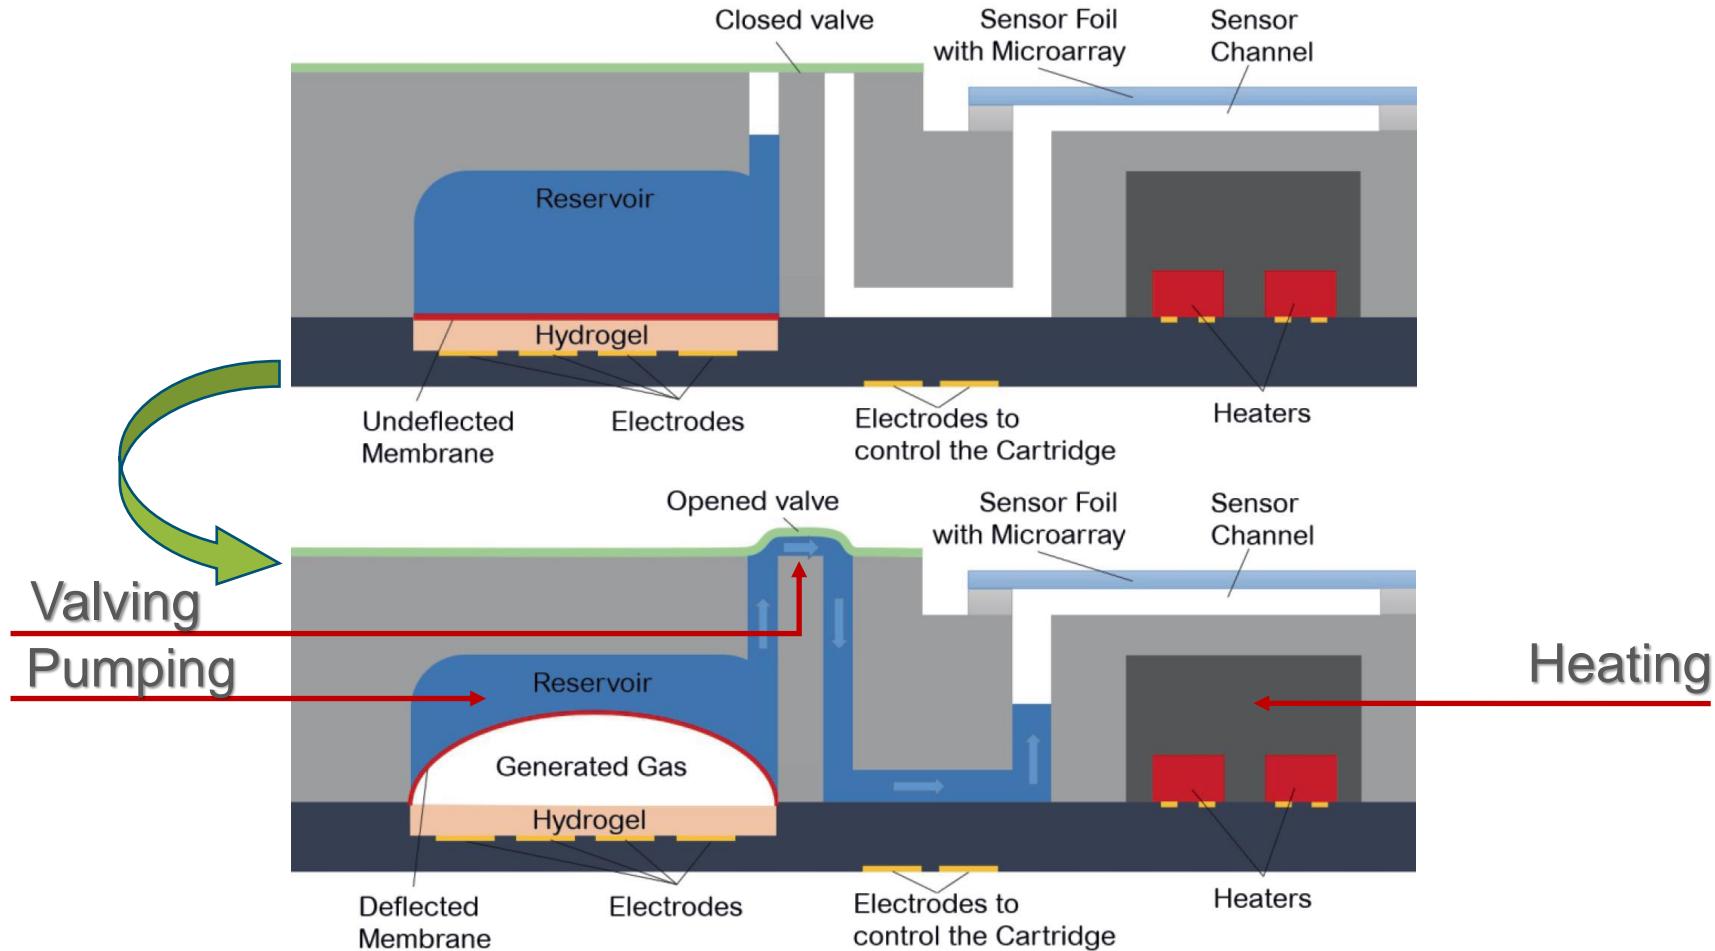

On-Chip pumps + reagents

Microfluidics  
InnovationHub

# Technology behind...

# Technology in use: pumping & heating

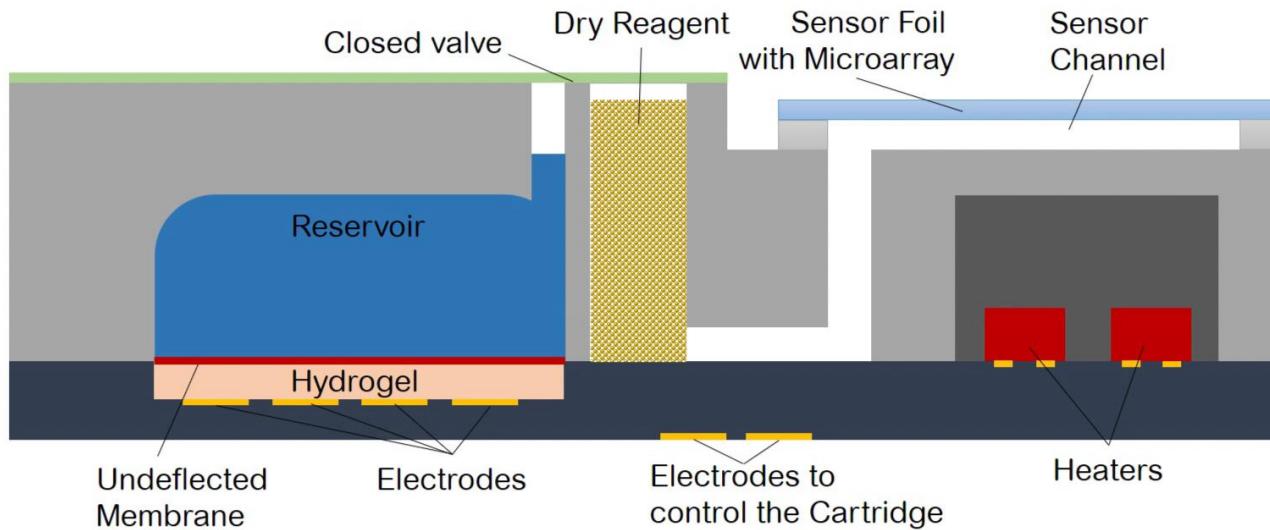

Video

<https://youtu.be/vhli67stfE>

Microfluidics  
InnovationHub

# Technology in use: dry reagents

Dry reagents can be integrated using a porous matrix.

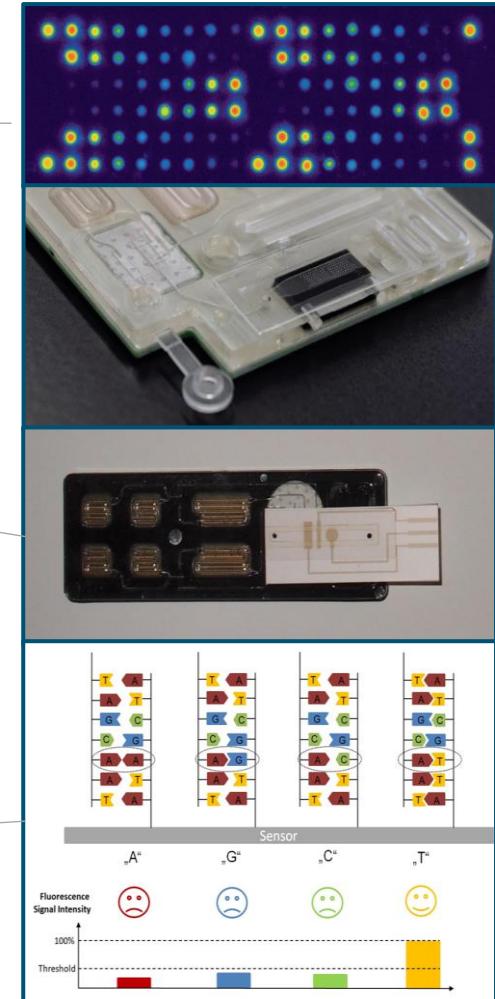

The release buffer is stored as described before as liquid.

Video: <https://youtu.be/vhli67stfE>

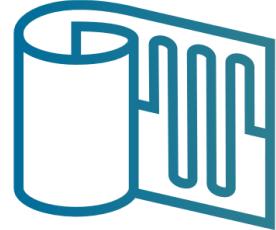

# Sensors, Assays, Applications...

- Microarray Integration
- Biosensor Integration
  - Photonic Biosensors
  - Electrochemical Biosensors
  - ...
- Assay Integration
  - Immunoassays
  - DNA / RNA-based assays
  - Bead-based assays
  - ...
- Examples
  - ELISA-like assays (antigen/antibody detection)
  - DNA-based bacterial species detection
  - DNA-based antibiotic resistance detection
  - RNA-based detection by „new“ integrated amplification method

Microfluidics  
InnovationHub

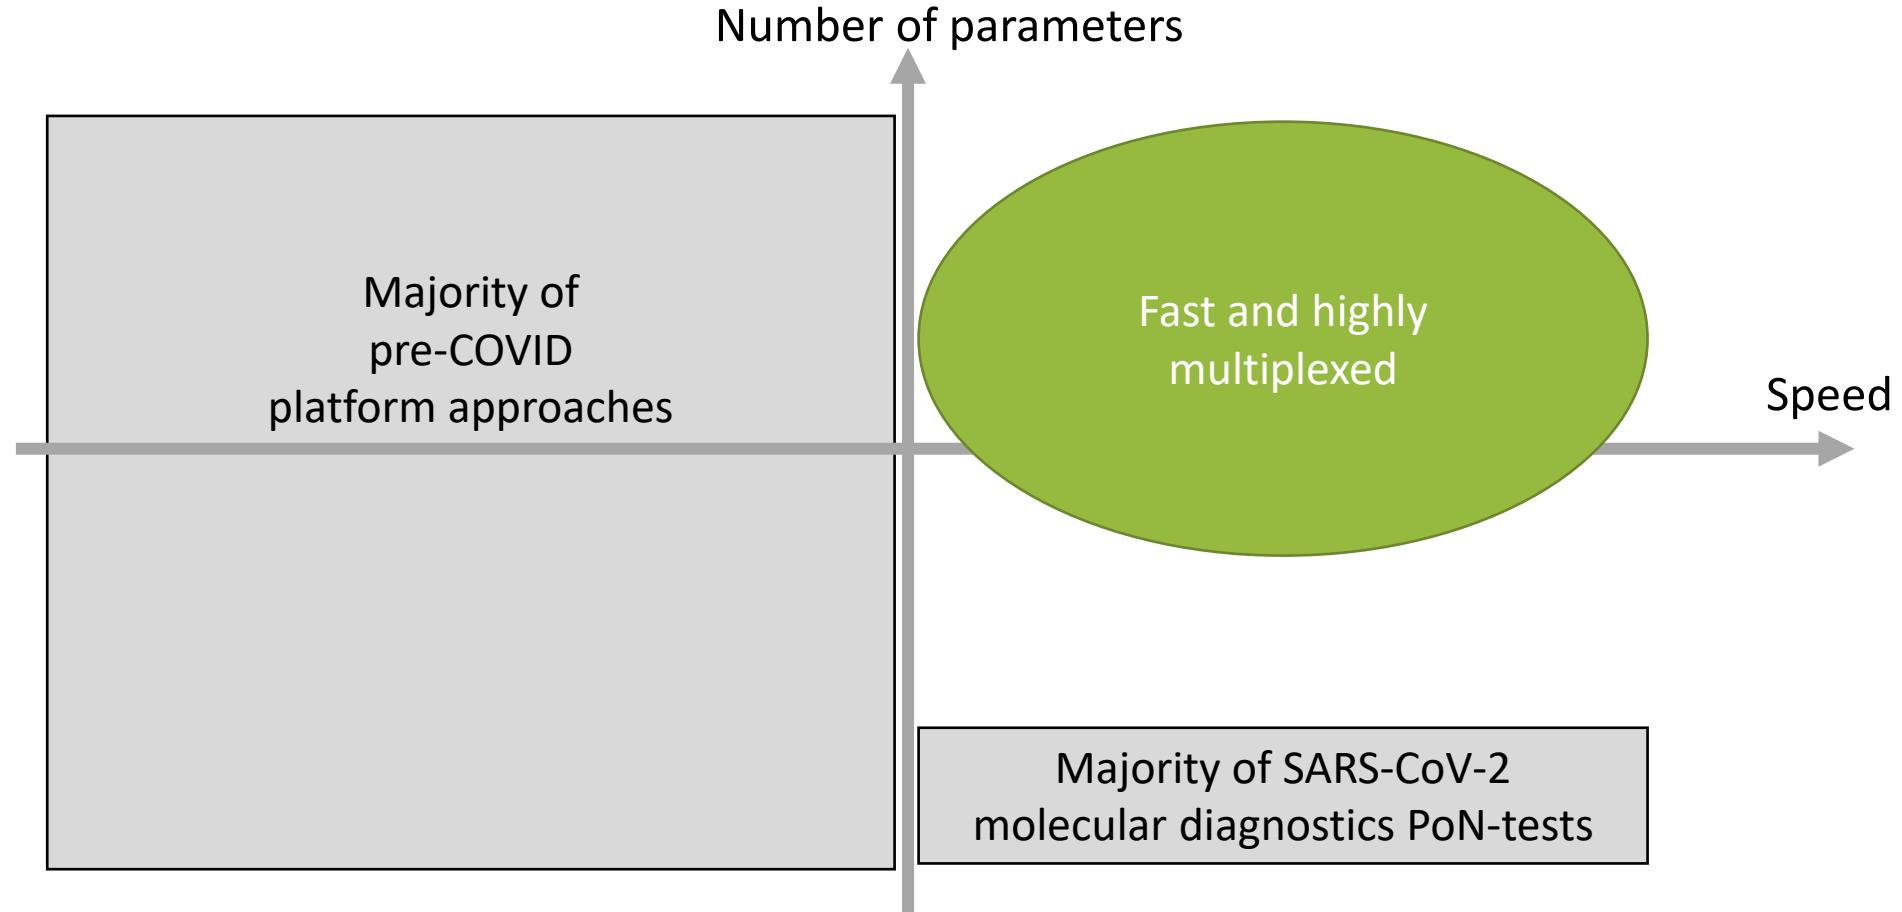

Microfluidics  
InnovationHub

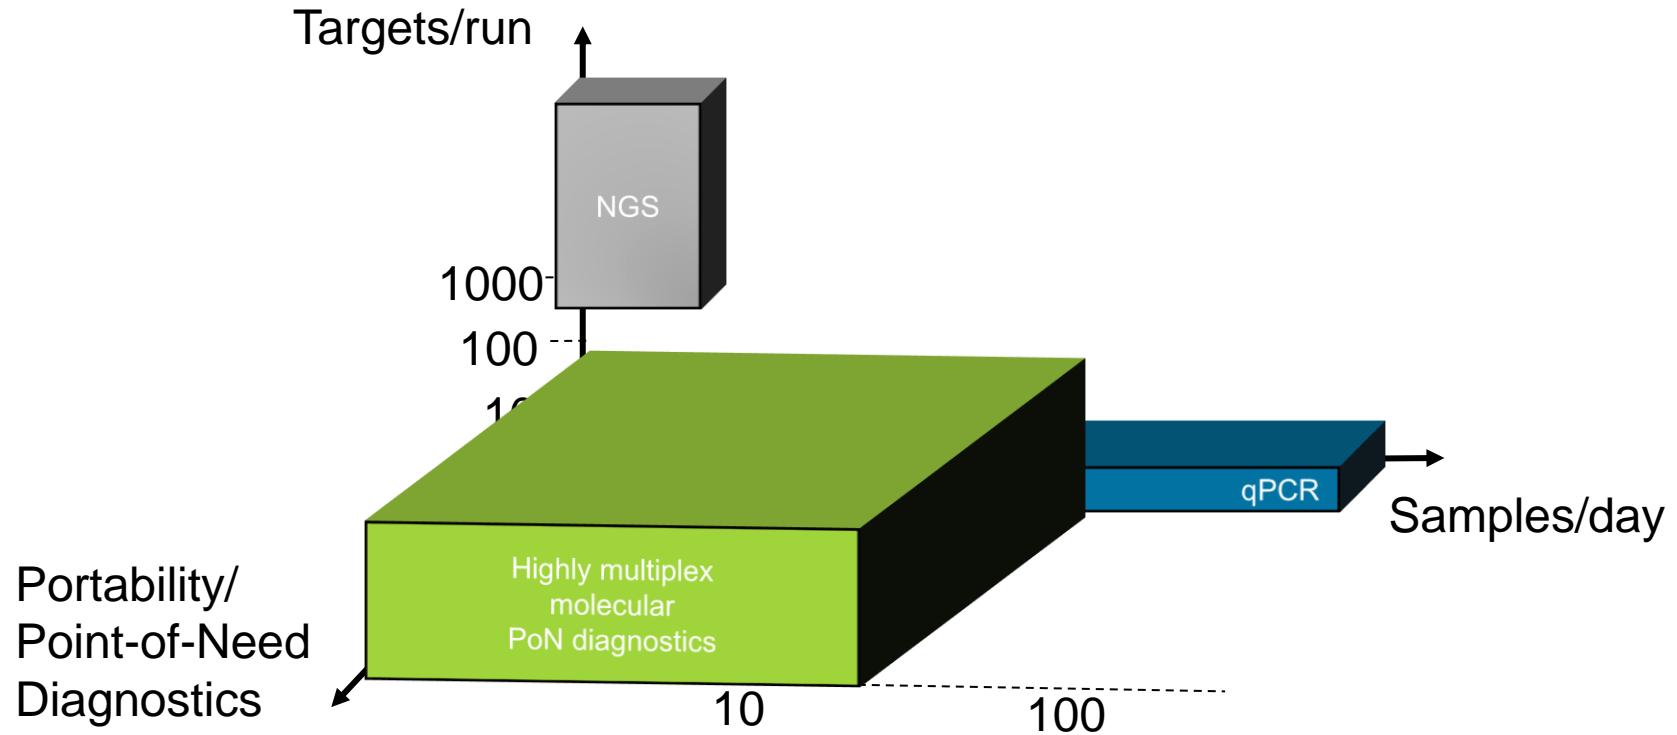

# Towards Multiplexing

# Multiplex molecular point-of-need diagnostics

# Multiplex molecular point-of-need diagnostics

# Multiplexing - Why

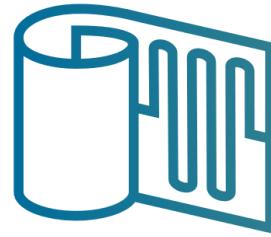

- Certain applications require a larger number of parameters, e.g.
  - Identification / differentiation of
    - Bacterial species
    - Fungus
    - Virus types or their variants
    - Animal and plant species
  - (genotypic) drug resistance testing  
(especially if for different species)
  - ...

# Multiplexing - Ways to do

- During amplification
  - multiplex qPCR or quantitative isothermal amplification – **single well**
    - Limited, typically not more than 6-plex
    - Limited for most isothermal methods
  - singleplex qPCR or end-point PCR or isotherm. amplif. – **multiple wells**
    - Not limited and possible also for all isothermal methods, however addressing multiple wells limits multiplexing during integration
- During detection
  - spacial resolution of different probes, e.g. by specific hybridization on microarray (optical, electrochemical, ...)
- Combination of both

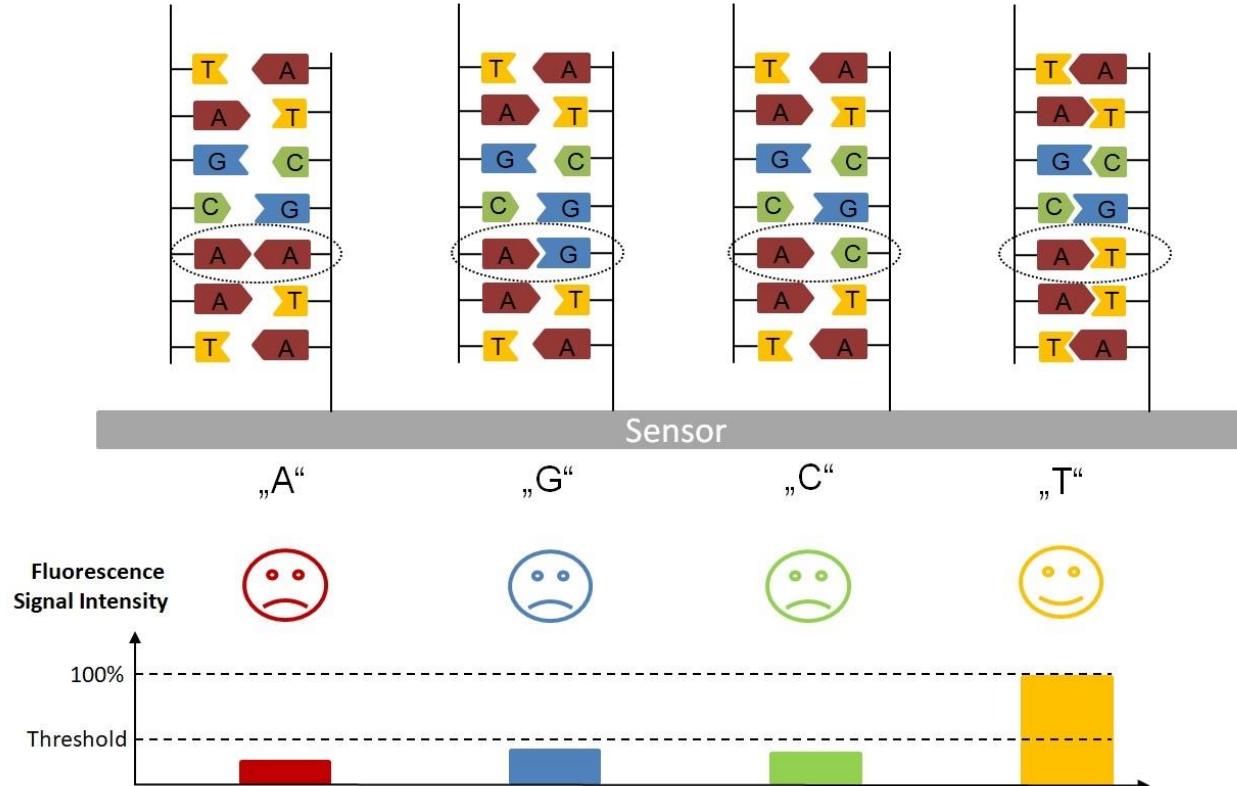

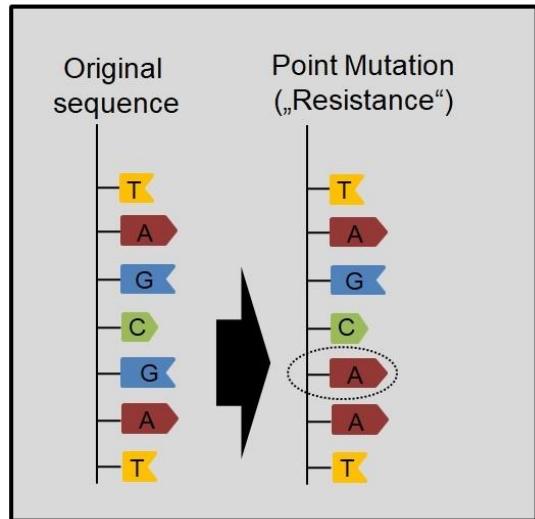

Microfluidics  
InnovationHub

# Speed (an example)

# About SNP detection

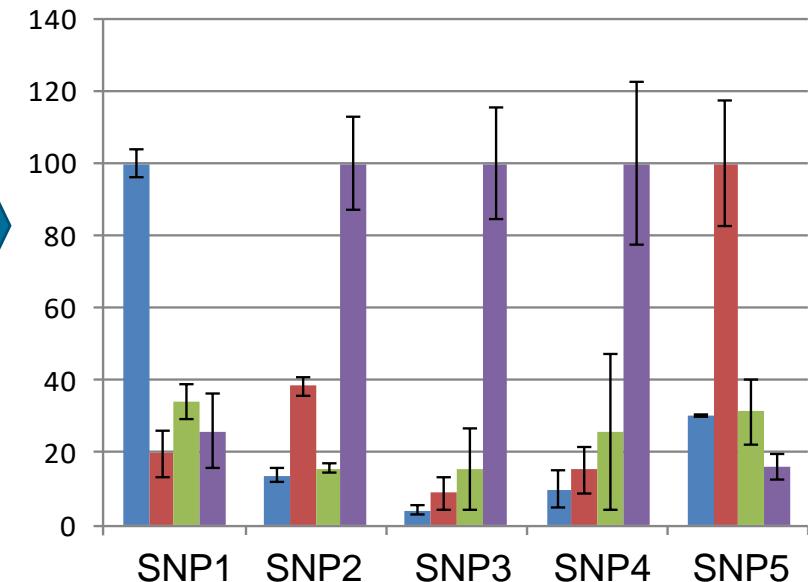

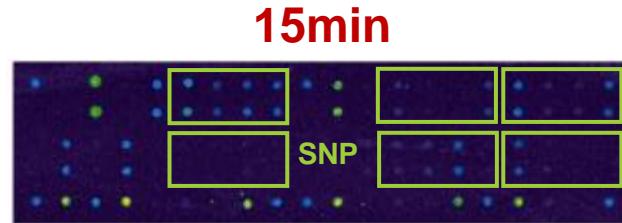

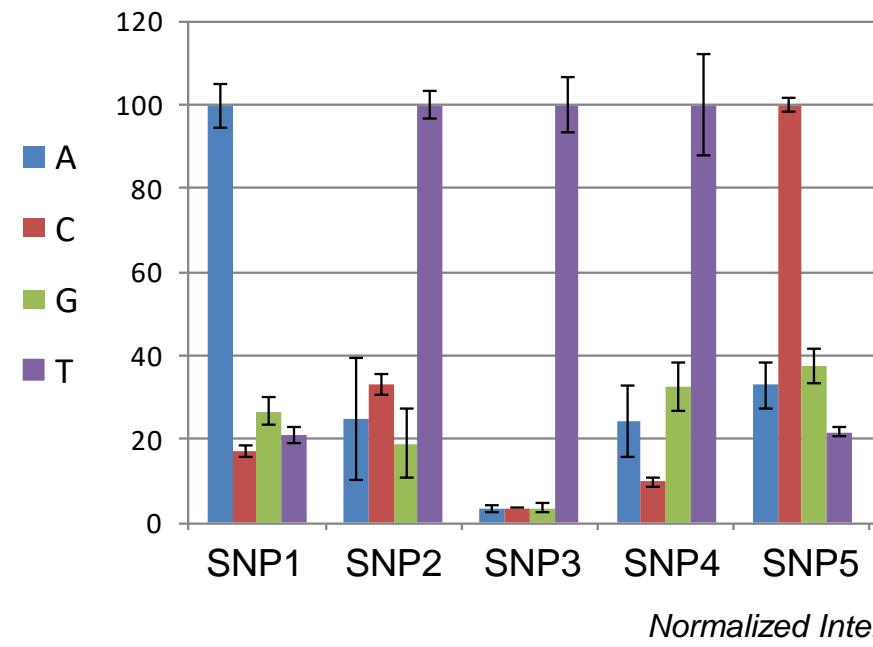

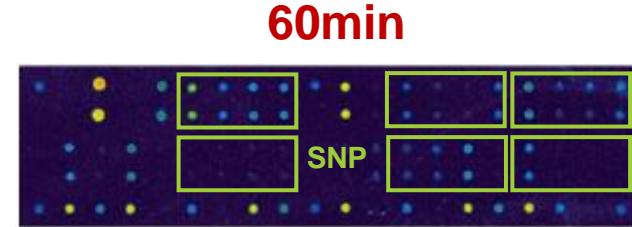

J. Nestler, H. Peter, F.F. Bier, Optik&Photonik 13, 2 (2018), 28-31

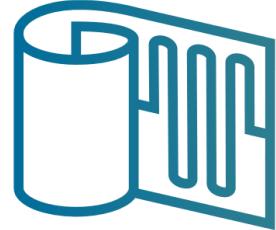

# Hybridization speed

MANUAL Hybridization in Laboratory  
**120min** (lots of labour work)

**AUTOMATIC Hybridization in Cartridge**

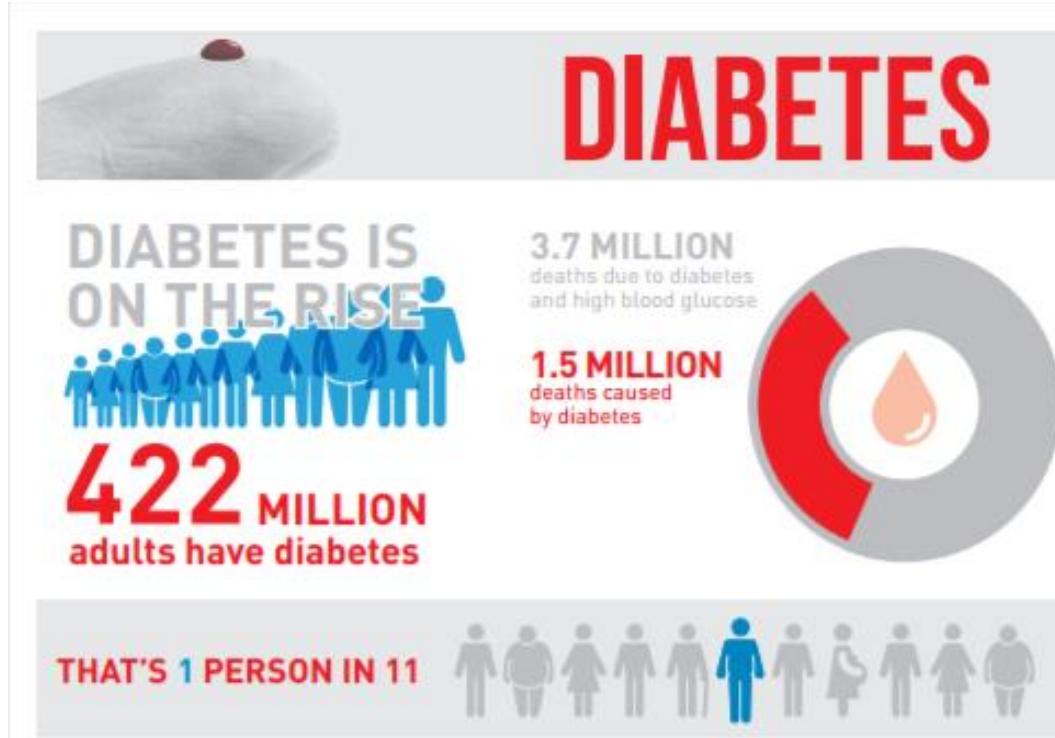

Microfluidics  
InnovationHub

# Application: **Bacterial species & AMR** **(for diabetic foot ulcers)**

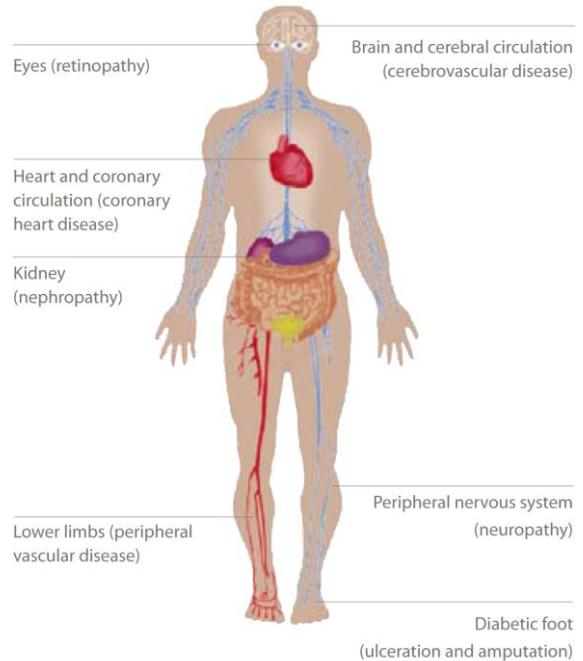

# Diabetic foot ulcer

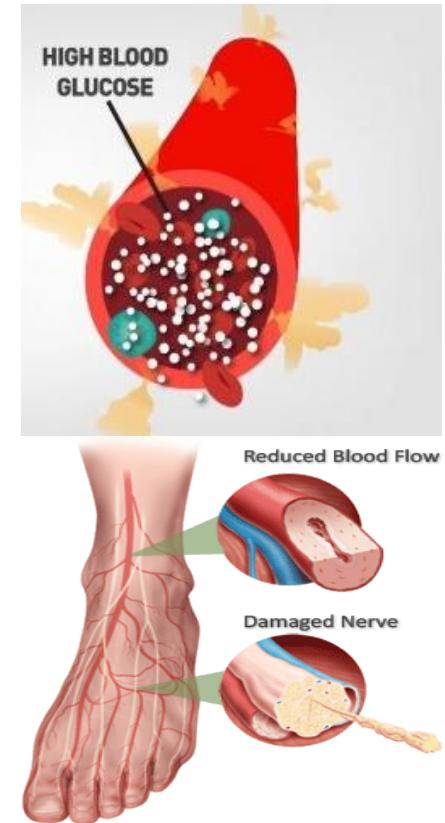

WHO: fact sheet on Diabetes (2018)

## THE MAJOR DIABETIC COMPLICATIONS

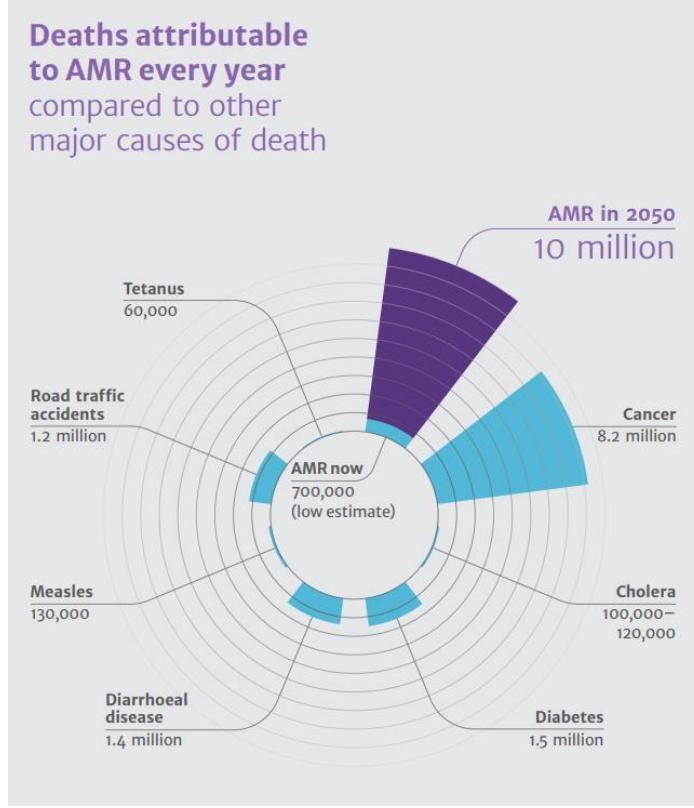

Source: *Diabetes Atlas* 3rd Ed., © International Diabetes Federation, 2006

Prevalence of Diabetic foot ulcer world-wide  
**Global average: 6.3%; Europe: 5.1%**  
**India: 11.6%; Germany 2.8%**

(commons.wikimedia.org)

# Antimicrobial Resistances

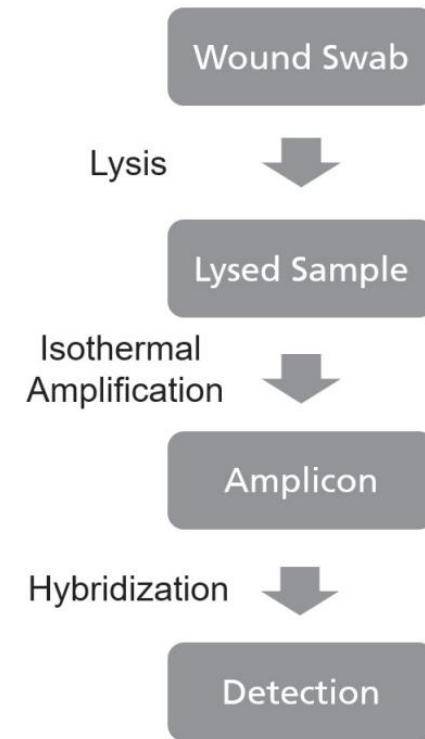

<https://www.weforum.org/agenda/2018/03/india-s-war-on-antimicrobial-resistance>

Img src: <https://kangarama.com/pages/eskape>

↑ drug resistance + ↓ novel antibiotic R&D = The end of the “Antibiotic Era”

# System Workflow

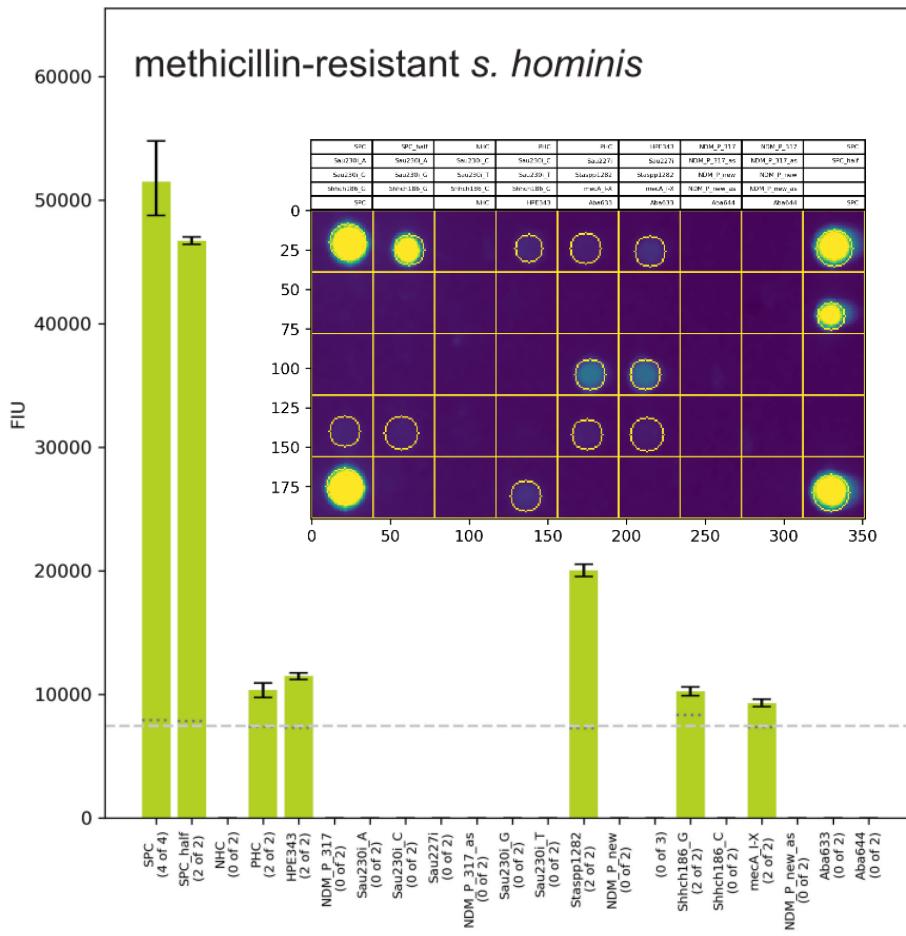

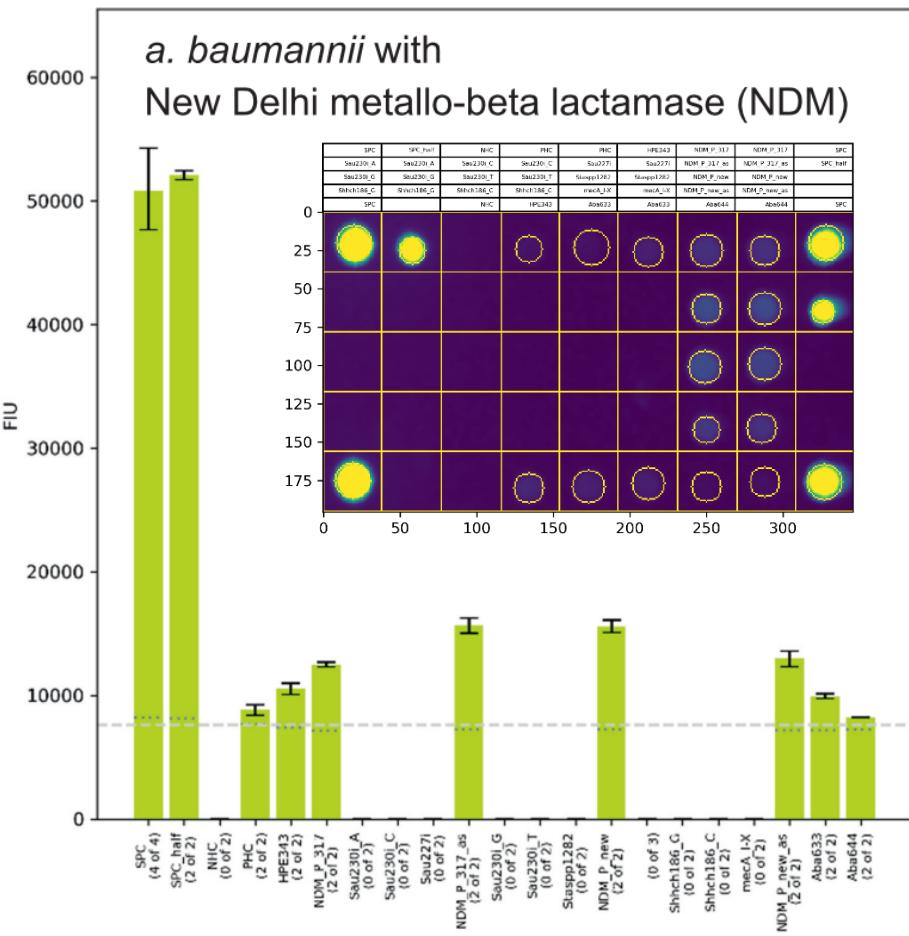

# Reader to control and read the cartridge

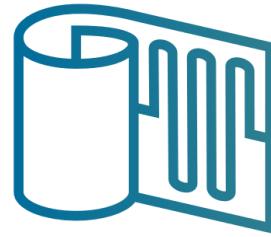

Successfully demonstrated combining Microarray + Cartridge + Reader:

- ✓ Amplification on Cartridge in Reader
- ✓ Hybridization on Cartridge in Reader
- ✓ Microarray Readout in Reader
- ✓ Successful detection of different pathogens and resistances

# **Example Results (Cartridge + Instrument)**

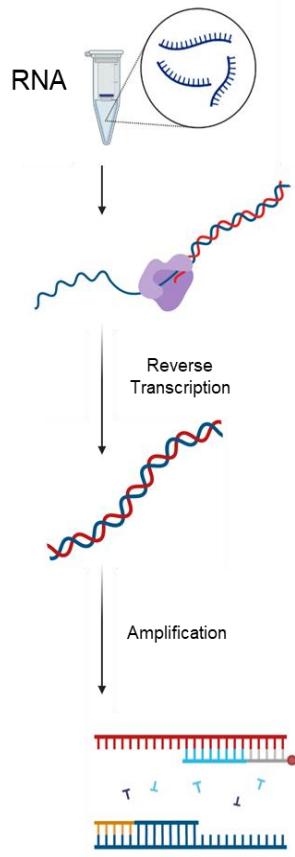

Microfluidics  
InnovationHub

# Application: **SARS-CoV-2 or Influenza?**

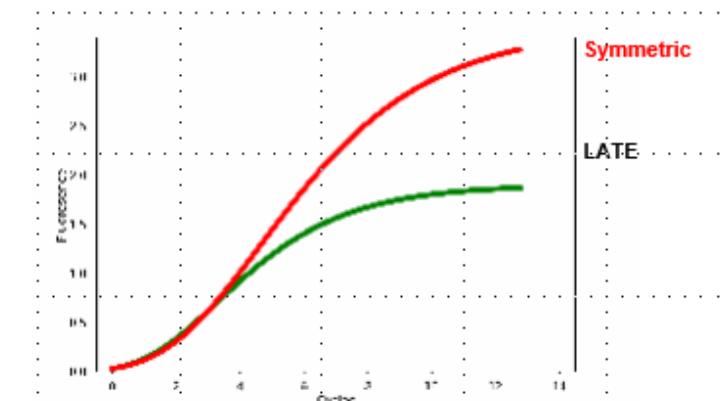

# ssDNA vs. dsDNA for hybridization?

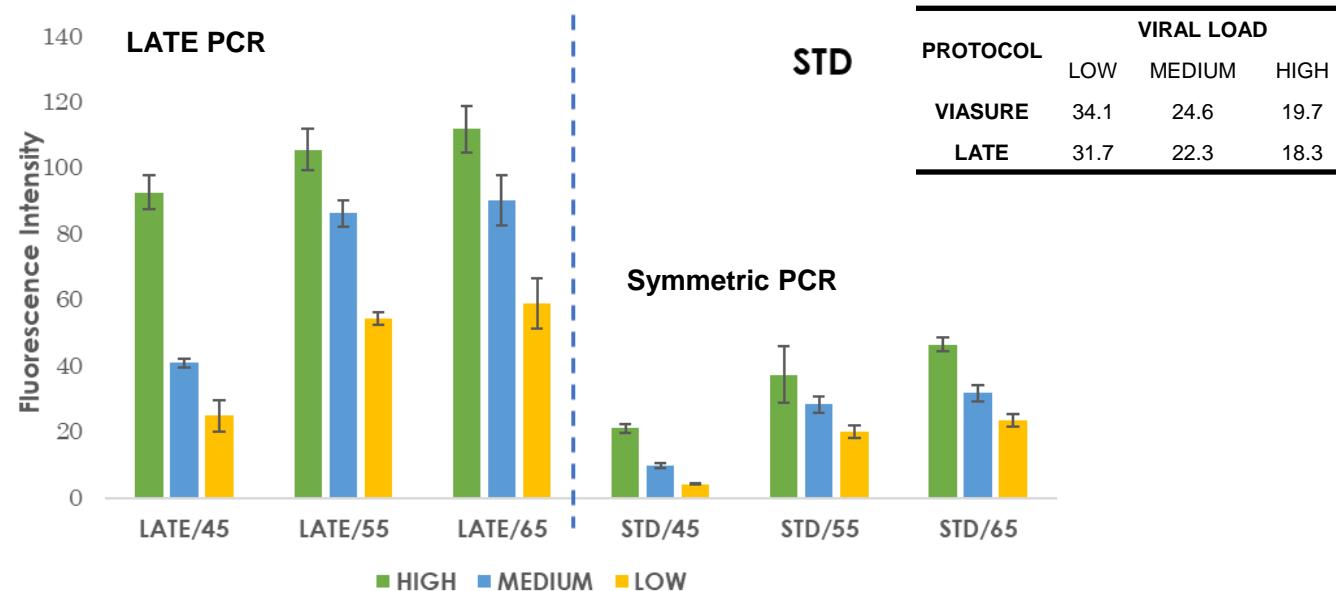

- ssDNA is better suited for hybridization on microarray  
→ faster hybridization
- **Linear after the exponential (LATE) PCR**  
→ A variant of asymmetric PCR...  
→ made efficient through primer modification

Generation of ssDNA  
in excess

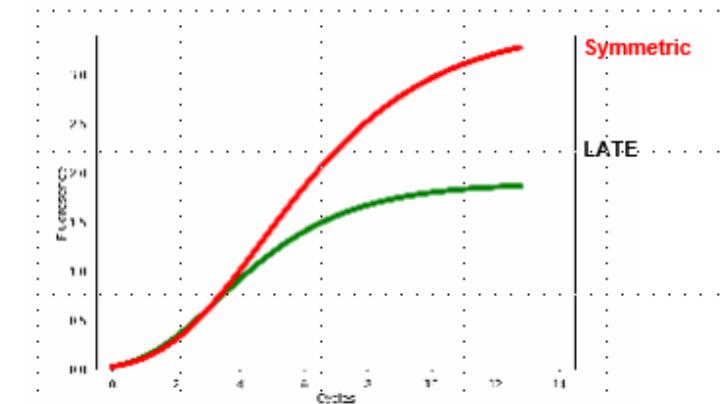

# ssDNA vs. dsDNA for hybridization?

- Hybridization results for LATE PCR vs. standard PCR

Amplification of the IP2 gene of SARS-CoV-2 in real patient samples and subsequent hybridization of the amplicon with immobilized probes

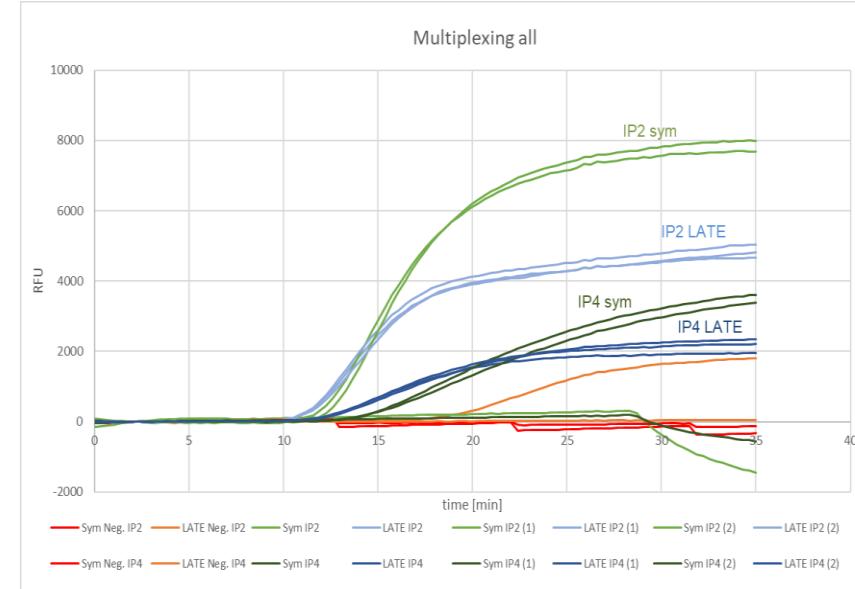

# From LATE-PCR to LATE psiPCR

Conventional thermocycler (left)  
vs pseudo-isothermal PCR cycler (right)  
(1500bp: 2hours vs. 30min)

Multiplexed LATE psiPCR (1000 copies of artificial RNA)

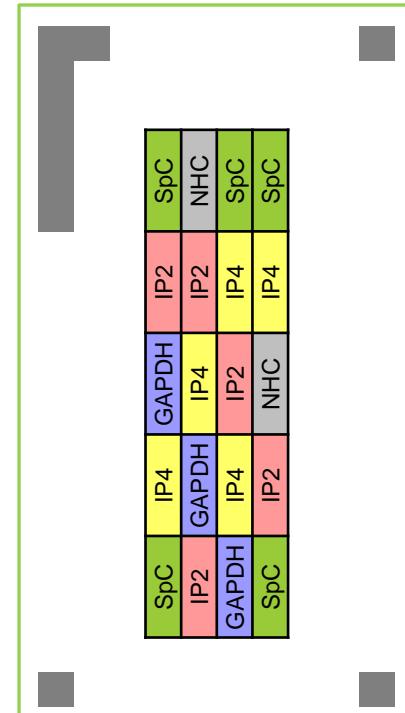

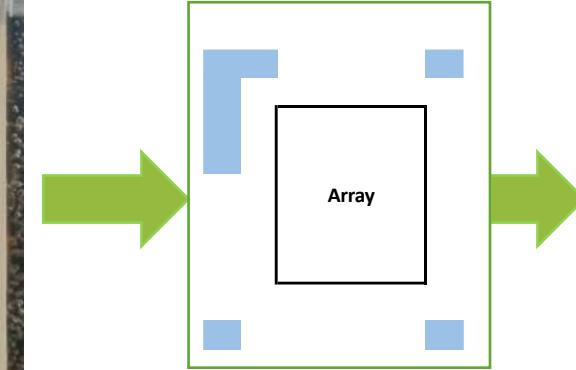

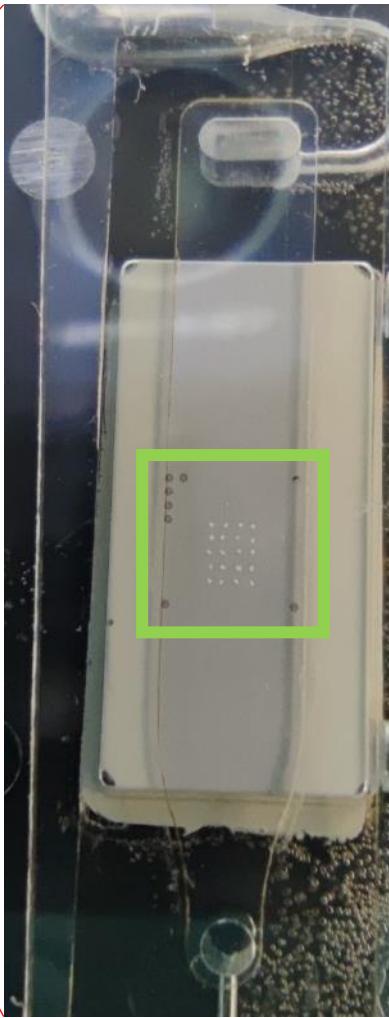

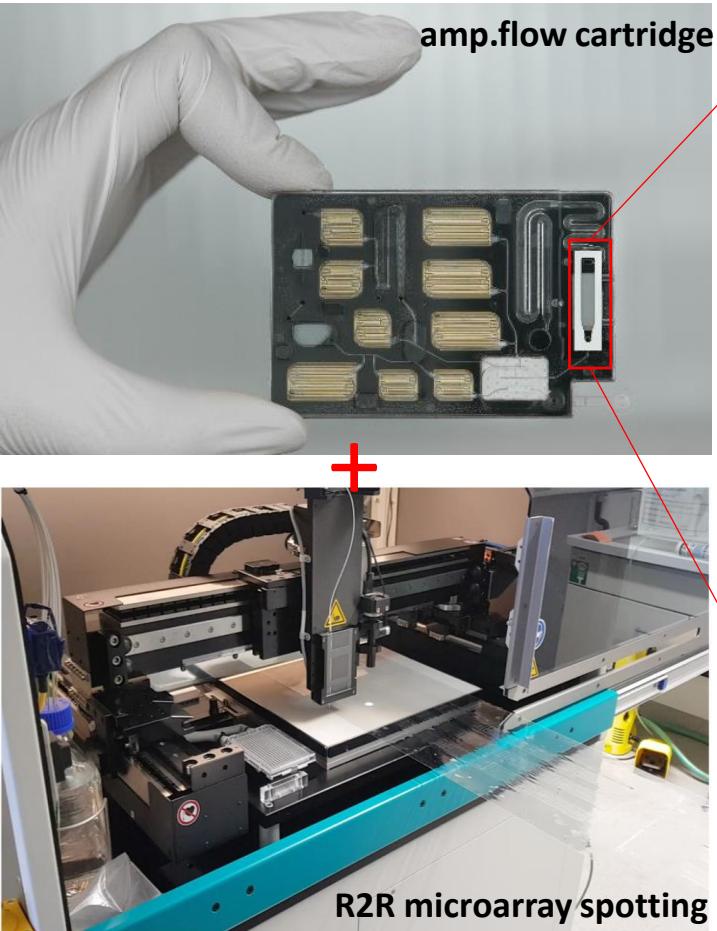

- ✓ Reduction in time-to-result & power consumption
- ✓ Simplification of cartridge design

Microfluidics  
InnovationHub

# Hybridization cartridge

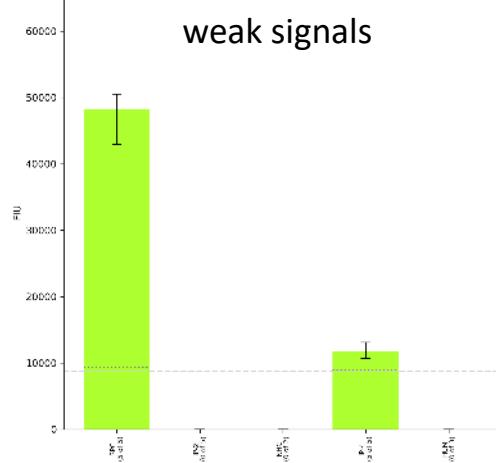

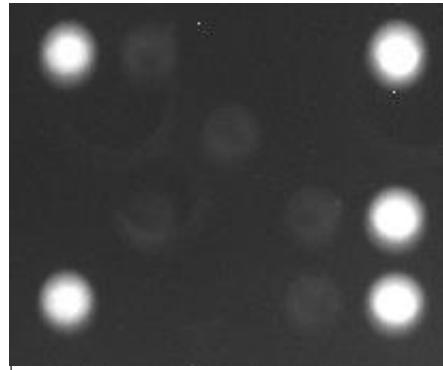

Microfluidics  
InnovationHub

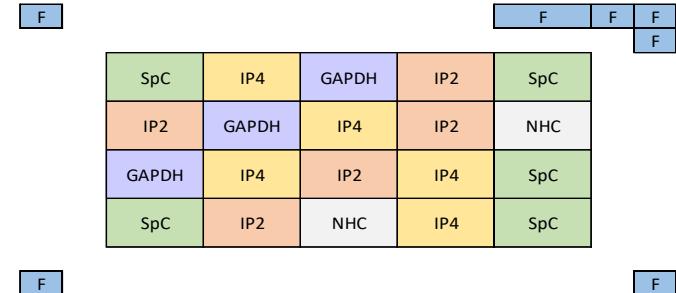

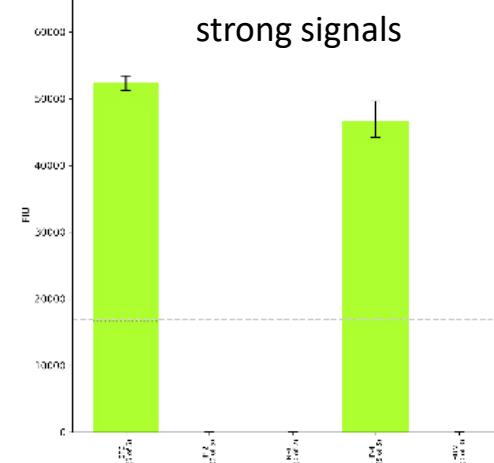

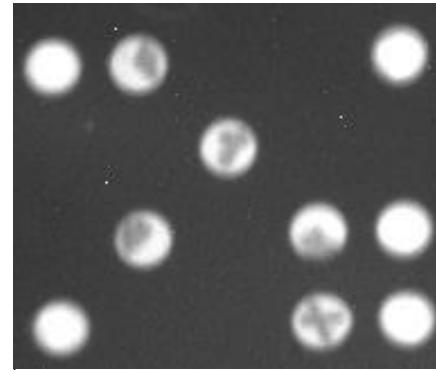

# Symmetric psiPCR vs. LATE psiPCR: Hybridization results

Symmetric

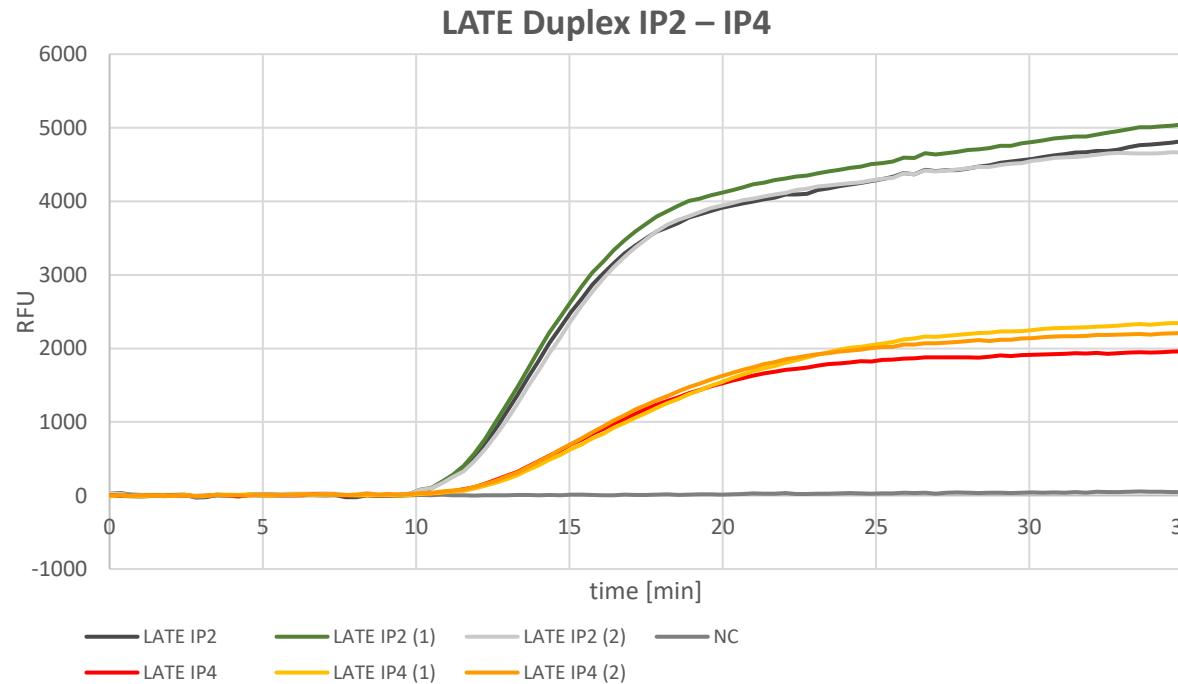

LATE psiPCR

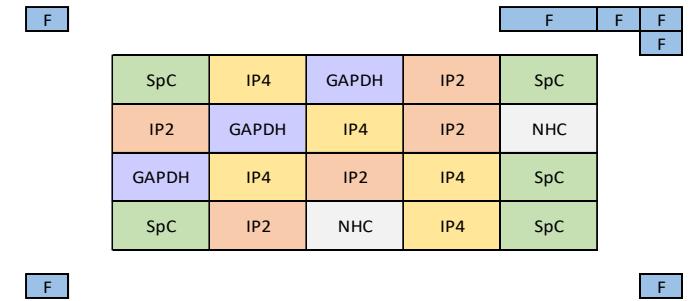

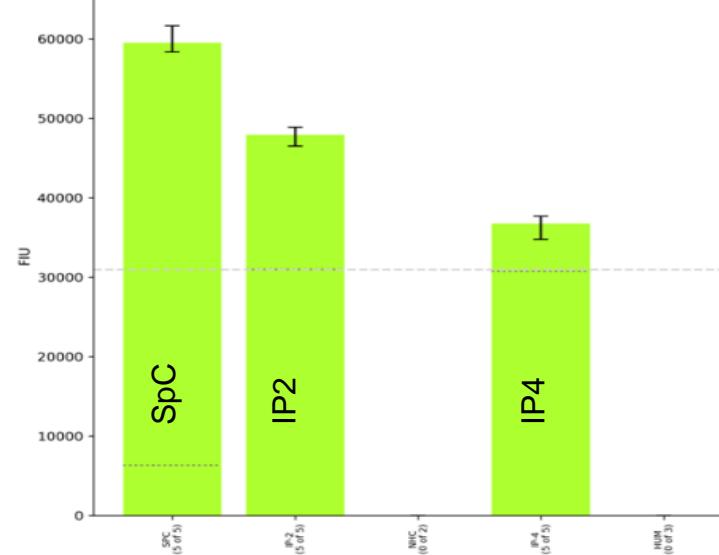

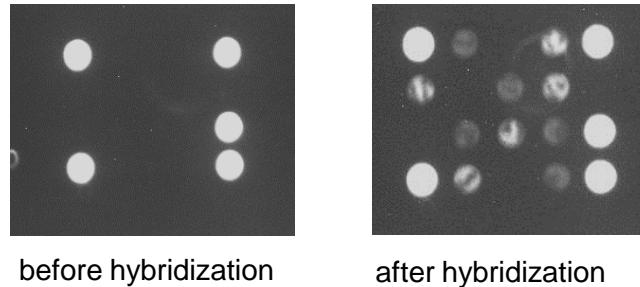

Microfluidics  
InnovationHub

# Duplex LATE q-psiPCR, patient sample

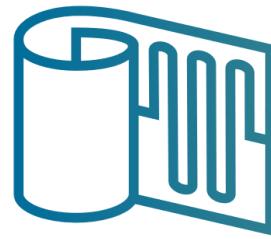

→ Now transfer that protocol to endpoint psiPCR for hybridization on microfluidic cartridge

# Duplex LATE q-psiPCR, patient sample

# SUMMARY

# Summary

- Aspects and strategies to consider for Lab-on-a-Chip for molecular diagnostics:
  - Level of Integration
  - Level of Multiplexing
  - Speed
- Examples
  - Bacterial Species Identification & AMR
  - Virus identification

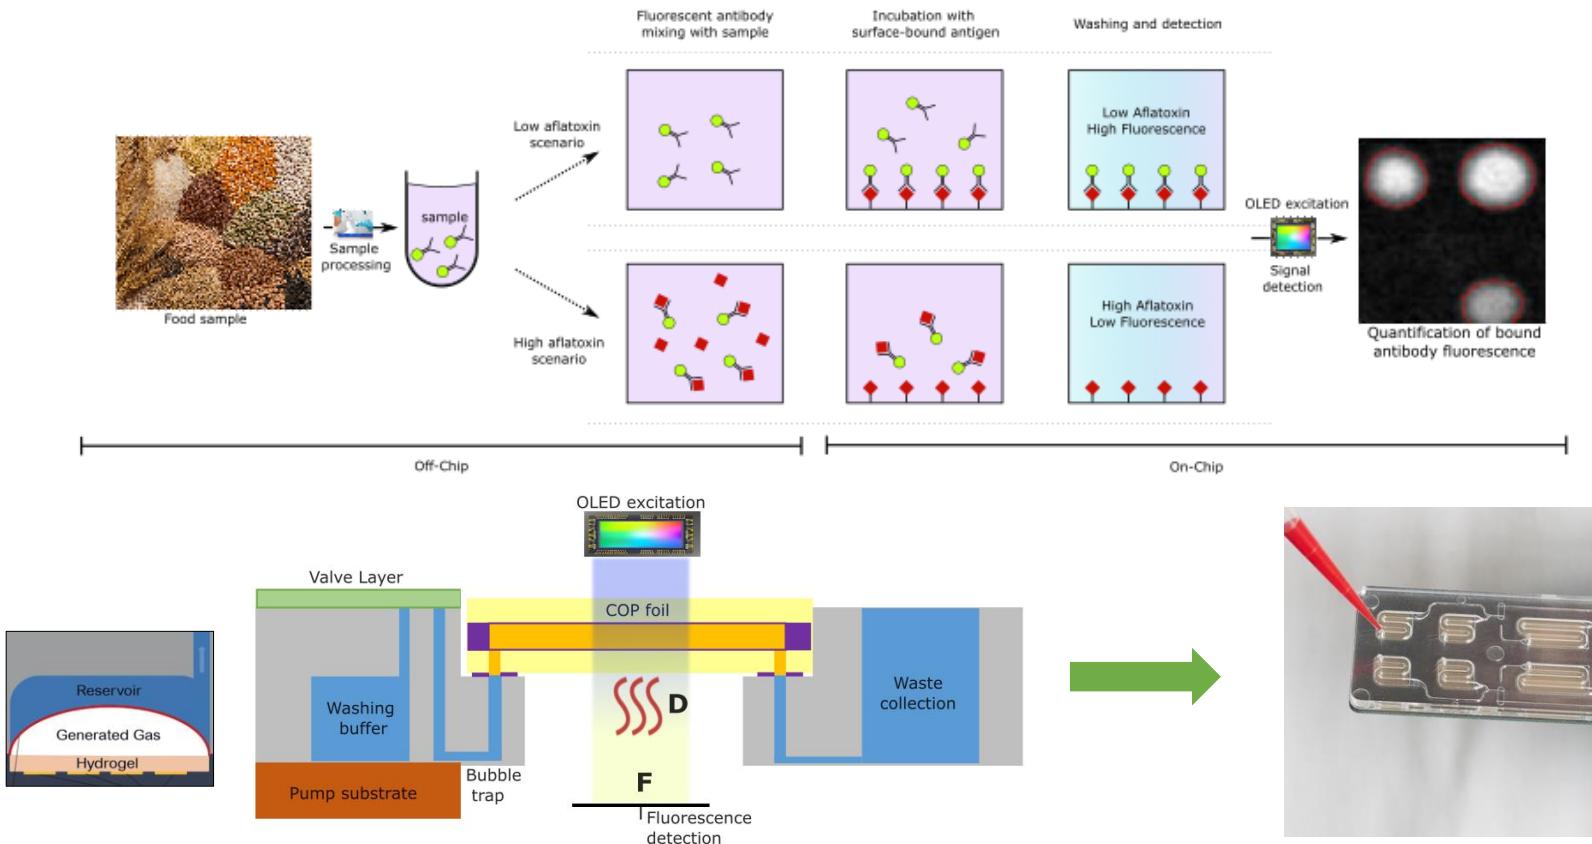

Microfluidics  
InnovationHub

# Question Time!

## Competitive ELISA for high-sensitivity detection of mycotoxins Aflatoxin A1 / M1

### Benchtop Readout Device

- OLED excitation and detection technology by Or:el
- Non-expert operation

### Fully integrated and automated disposable microfluidic Cartridge

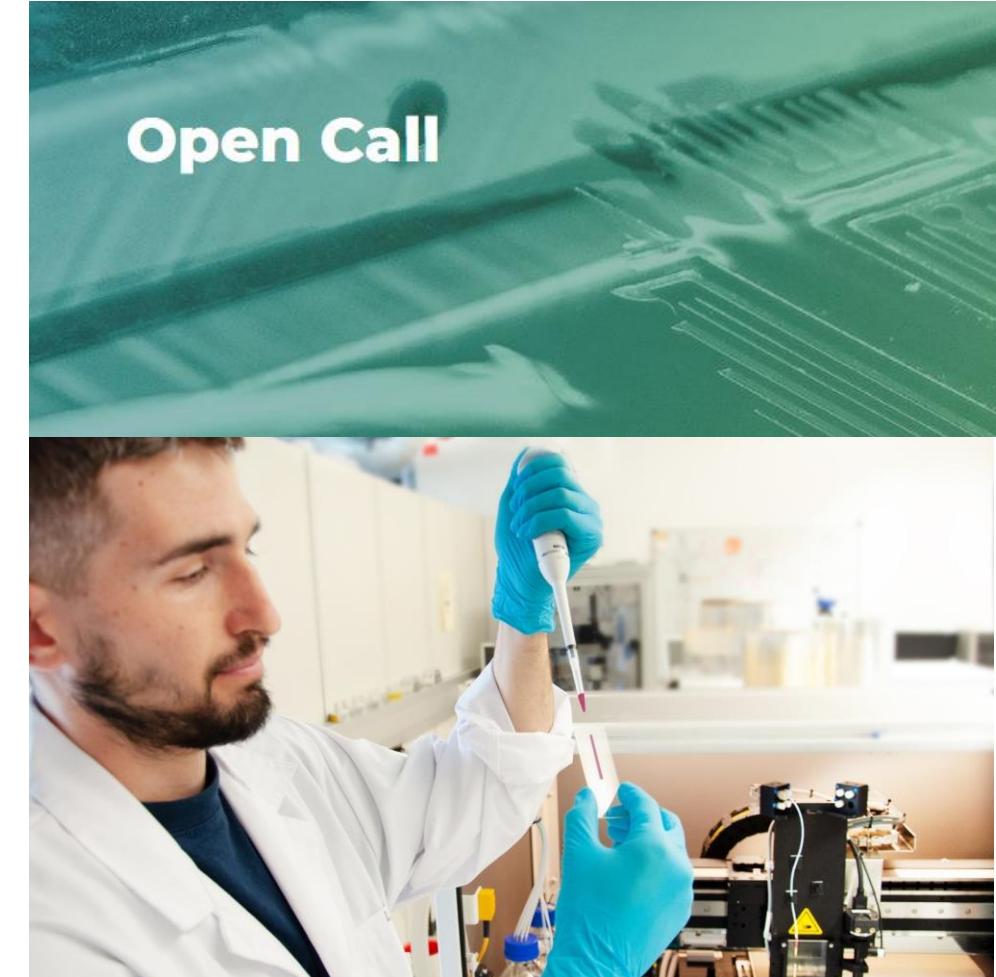

- Low-cost
- 6-12 month shelf life
- Integrated liquid reagent storage
- Complete automation with integrated electronics
- Low footprint (standard microscopy slide dimensions)
- Flexibility – multiple toxin<sup>46</sup> detection possible

Microfluidics  
InnovationHub

# Accelerate your Microfluidic Innovation

- Addresses companies – SMEs and LEs
- Access to all services of the NGM OITB - min 2 partners involved
- Budget up to EUR 200.000
- Duration: 6 to 12 months
- Funding rate of up to 92% and 50% for European SMEs and Large Enterprises respectively
- Technology Readiness Level > 4 or Microfluidic System available
- Managed & coordinated by the MIH
- Details see: [www.nextgenmicrofluidics.eu/open-call/](http://www.nextgenmicrofluidics.eu/open-call/)
